

Regulatory spillovers and asset pricing implications of stablecoin legislation: Evidence from the GENIUS Act event study and DCC-GARCH analysis

稳定币立法的监管溢出与资产定价含义：来自 GENIUS 法案事件研究与 DCC-GARCH 分析的证据

Abstract

This paper examines how stablecoin regulatory announcements affect U.S. financial and crypto-related equity markets, using a multi-method approach that combines event study methodology, DCC-GARCH dynamic correlation analysis, and panel fixed-effects regressions. Focusing on eight key legislative milestones of the GENIUS Act and CLARITY Act in 2025, we document strong evidence of sectorally differentiated market reactions. Pure-play crypto-concept stocks significantly underperform traditional financial stocks around pro-regulation news: around the Senate Banking Committee approval of the GENIUS Act (March 13, 2025), crypto-concept stocks earned a 3-day cumulative abnormal return (CAR) of -4.59%, compared with -1.68% for large banks, and the gap widens to roughly 8.5 percentage points over a [-3,+3] window. Symmetrically, when a Senate cloture motion failed on May 8, 2025—a setback for the legislation—crypto-concept stocks rallied by 5.82% while large banks were flat. Around the Senate passage of the GENIUS Act (June 17, 2025), large banks earned a significant positive 3-day CAR of 1.76% while crypto-concept stocks lost 3.65%. DCC-GARCH estimates show that dynamic conditional correlations between stablecoin market capitalization changes and equity returns increased significantly after regulatory clarification for all sectors, with the bank–stablecoin correlation rising from 0.08 to 0.10. Panel regressions show that the sensitivity of equity returns to stablecoin issuance growth remains concentrated in crypto-concept and exchange stocks both before and after regulation; we find no evidence that bank and payment stock returns acquired a significant new exposure to stablecoin issuance after the legislative breakthrough. Cross-sectional regressions confirm that firms with higher crypto revenue exposure experienced more negative abnormal returns around the key markup event. Robustness checks using placebo event dates, alternative factor models, alternative stablecoin measures, and the exclusion of confounding macroeconomic announcements support the cross-sectional interpretation. Our findings provide systematic evidence on how equity markets price stablecoin regulation: regulation creates winners and losers across financial sectors, and accelerates the integration of stablecoin markets with traditional finance.

本文采用事件研究法、DCC-GARCH 动态相关分析与面板固定效应回归相结合的多方法框架，考察稳定币监管公告如何影响美国金融类与加密概念类股票市场。围绕 2025 年 GENIUS 法案与 CLARITY 法案的八个关键立法节点，我们发现了板块间高度差异化市场反应的强证据。纯加密概念股在支持监管推进的消息前后显著跑输传统金融股：在参议院银行委员会通过 GENIUS 法案（2025 年 3 月 13 日）前后，加密概念股的 3 日累计异常收益（CAR）为-4.59%，而大银行为-1.68%；在 $[-3,+3]$ 窗口内两者差距扩大至约 8.5 个百分点。对称地，当参议院终止辩论动议于 2025 年 5 月 8 日失败——即立法受挫——时，加密概念股上涨 5.82%，而大银行基本持平。在参议院全院通过 GENIUS 法案（2025 年 6 月 17 日）前后，大银行获得显著为正的 3 日 CAR（1.76%），而加密概念股下跌 3.65%。DCC-GARCH 估计显示，监管澄清后所有板块的股票收益与稳定币市值变动之间的动态条件相关均显著上升，银行—稳定币相关系数从 0.08 升至 0.10。面板回归显示，股票收益对稳定币发行增长的敏感性在监管前后始终集中于加密概念股与交易所股；没有证据表明立法突破后银行与支付股收益对稳定币发行获得了显著的新敞口。横截面回归证实，加密收入敞口越高的公司在关键审议事件前后的异常收益越负。基于伪事件日、替换因子模型、替换稳定币度量以及剔除宏观公告混淆的稳健性检验均支持上述横截面解释。我们的发现为股票市场如何对稳定币监管定价提供了系统性证据：监管在不同金融板块间造就了赢家与输家，并加速了稳定币市场与传统金融的融合。

Keywords: Stablecoin regulation, Event study, GENIUS Act, DCC-GARCH, Financial stocks, Crypto assets

1. Introduction / 引言

Stablecoins—digital tokens designed to maintain a stable value relative to fiat currencies, most commonly the U.S. dollar—have grown from a niche crypto market instrument to an asset class of over \$250 billion that sits at the intersection of decentralized finance (DeFi) and traditional financial intermediation. The rapid growth of stablecoins has sparked intense regulatory debate globally, and in 2025 the United States enacted its first comprehensive federal framework for payment stablecoins: the GENIUS Act (Guiding and Establishing National Innovation for U.S. Stablecoins Act), signed into law on July 18, 2025, alongside the CLARITY Act (Digital Asset Market Clarity Act), a broader market-structure bill that passed the House of Representatives on July 17, 2025. The GENIUS Act establishes federal oversight of stablecoin issuers, imposes 100% reserve requirements in high-quality liquid assets, and clarifies which financial institutions are permitted to issue stablecoins.

稳定币——即旨在相对法定货币（最常见为美元）保持稳定价值的数字代币——已从加密市场中的小众工具成长为规模超过 2500 亿美元的资产类别，处于去中心化金融（DeFi）与传统金融中介的交汇点。稳定币的快速增长在全球范围内引发了激烈的监管辩论。2025 年，美国颁布了首个针对支付型稳定币的联邦综合监管框架：GENIUS 法案（《引导和建立美国稳定币国家创新法案》），于 2025 年 7 月 18 日签署生效；与之并行的还有覆盖更广的市场结构法案 CLARITY 法案（《数字资产市场清晰法案》），于 2025 年 7 月 17 日在众议院获得通过。GENIUS 法案确立了联邦层面对稳定币发行人的监管，要求以高质量流动资产维持 100% 准备金，并明确了哪些金融机构获准发行稳定币。

Despite the high stakes of this legislation for both the crypto industry and traditional financial institutions, there is little existing empirical evidence on how equity markets price stablecoin regulatory announcements. This paper fills this gap by conducting a compre-

hensive analysis of how stablecoin regulation affects valuations across different sectors of the financial industry. We exploit the staggered legislative process of the GENIUS and CLARITY Acts as a series of quasi-natural experiments to answer three questions: First, do stablecoin regulatory announcements produce significant abnormal returns in financial and crypto-related stocks? Second, how do market reactions differ across sectors (large banks, regional banks, payment companies, crypto exchanges, crypto-concept stocks)? Third, has regulatory clarification changed the dynamic relationship between stablecoin market activity and equity returns?

尽管该立法对加密行业 and 传统金融机构都影响重大, 但现有文献中鲜有关于股票市场如何对稳定币监管公告定价的实证证据。本文通过全面分析稳定币监管对金融业不同板块估值的影响填补了这一空白。我们利用 GENIUS 法案与 CLARITY 法案渐次推进的立法进程作为一系列准自然实验, 回答三个问题: 第一, 稳定币监管公告是否会在金融类与加密类股票中产生显著的异常收益? 第二, 不同板块 (大银行、区域银行、支付公司、加密交易所、加密概念股) 的市场反应有何差异? 第三, 监管澄清是否改变了稳定币市场活动与股票收益之间的动态关系?

Our analysis yields several key findings. First, event study results reveal sharply differentiated market reactions across sectors, but with an important nuance: raw CARs around individual events are heavily influenced by concurrent macroeconomic conditions, so the cleanest evidence comes from cross-sector comparisons and from the symmetry of reactions to good and bad legislative news. Around the Senate Banking Committee approval of the GENIUS Act (March 13, 2025), which coincided with a broad market selloff, all sectors declined, but crypto-concept stocks (-4.59% 3-day CAR) and crypto exchanges (-6.09%) fell much more than large banks (-1.68%) and payment companies (+0.50%). When a Senate cloture motion unexpectedly failed on May 8, 2025, crypto-concept stocks gained 5.82% (significant at 5%) while banks were unchanged—a mirror image consistent with regulation being bad news for unregulated crypto business models. And around the Senate passage of the GENIUS Act on June 17, 2025, large banks earned a significant 1.76% 3-day CAR while crypto-concept stocks lost 3.65%, a spread of 5.4 percentage points. On average across all eight events, payment companies gained 0.47% per event and crypto exchanges gained 2.04%, while large banks lost 0.69% and crypto-concept stocks gained 0.68%, reflecting the dominance of idiosyncratic and macro shocks in raw event windows.

我们的分析得到以下几个主要发现。第一, 事件研究结果显示各板块市场反应高度分化, 但有一个重要细节: 单个事件前后的原始 CAR 深受同期宏观环境影响, 因此最干净的证据来自跨板块比较, 以及市场对立法好消息与坏消息反应的对称性。在参议院银行委员会通过 GENIUS 法案 (2025 年 3 月 13 日, 恰逢大盘抛售) 前后, 所有板块均下跌, 但加密概念股 (3 日 CAR 为 -4.59%) 与加密交易所股 (-6.09%) 的跌幅远大于大银行 (-1.68%) 与支付公司 (+0.50%)。当参议院终止辩论动议于 2025 年 5 月 8 日意外失败时, 加密概念股上涨 5.82% (5% 水平显著) 而银行基本持平——这一镜像反应与“监管对不受监管的加密商业模式是坏消息”的解读一致。在 2025 年 6 月 17 日参议院全院通过 GENIUS 法案前后, 大银行获得显著的 1.76% 的 3 日 CAR, 而加密概念股下跌 3.65%, 两者相差 5.4 个百分点。八个事件平均而言, 支付公司每一事件上涨 0.47%, 加密交易所上涨 2.04%, 大银行下跌 0.69%, 加密概念股上涨 0.68%, 反映出原始事件窗口中个股特质冲击与宏观冲击的主导作用。

Second, cross-sectional regressions show that the abnormal returns around the key markup event are systematically related to firm characteristics. Relative to crypto-concept stocks

(the omitted category, with a 3-day CAR of -4.59%), large banks outperformed by 2.91 percentage points, regional banks by 3.19, and payment companies by 5.09. Higher-beta firms exhibited more negative CARs, and firms with a higher share of crypto-related revenue experienced significantly more negative abnormal returns, consistent with regulation redistributing value from unregulated crypto activity toward regulated institutions.

第二，横截面回归显示，关键审议事件前后的异常收益与公司特征系统性相关。相对于加密概念股（省略基准组，3 日 CAR 为 -4.59% ），大银行跑赢 2.91 个百分点，区域银行跑赢 3.19 个百分点，支付公司跑赢 5.09 个百分点。高 beta 公司的 CAR 更偏负，加密相关收入占比越高的公司异常收益显著越负，这与监管将价值从未受监管的加密活动重新分配给受监管机构的机制一致。

Third, using the DCC-GARCH model of Engle [5], we find that dynamic conditional correlations between stablecoin market capitalization changes and equity returns increased significantly after regulatory clarification—for all sectors. The correlation between stablecoin growth and bank portfolio returns rose from 0.08 pre-legislation to 0.10 post-legislation; the correlation with payment stocks rose from 0.05 to 0.07; and even the already-high correlation with crypto-concept stocks rose from 0.18 to 0.21. Rather than a bank-specific structural break, the evidence points to a broad-based integration of stablecoin markets with the entire equity market once regulatory uncertainty was resolved.

第三，基于 Engle [5] 的 DCC-GARCH 模型，我们发现监管澄清后稳定币市值变动与股票收益之间的动态条件相关显著上升——且对所有板块均如此。稳定币增长与银行组合收益之间的相关系数从立法前的 0.08 升至立法后的 0.10；与支付股的相关系数从 0.05 升至 0.07；即便是本就较高的与加密概念股的相关系数也从 0.18 升至 0.21。证据并非指向银行特有的结构突变，而是表明一旦监管不确定性消除，稳定币市场与整个股票市场发生了全面的融合。

Fourth, panel fixed-effects regressions using daily stock returns qualify the pricing hypothesis: the sensitivity of equity returns to stablecoin issuance growth is large and highly significant for crypto-concept stocks (2.82% per 1% change in stablecoin market capitalization pre-regulation, 4.09% post-regulation) and crypto exchanges (1.77% pre, 3.14% post), but remains small and mostly insignificant for banks and payment companies both before and after the legislative breakthrough. In other words, stablecoin issuance became increasingly relevant for crypto-adjacent business models, but had not yet become a priced fundamental for traditional financial firms by mid-2026.

第四，基于日度股票收益的面板固定效应回归对定价假说构成了限定：股票收益对稳定币发行增长的敏感性对加密概念股而言很大且高度显著（监管前稳定币市值每变动 1% 对应 2.82% 的收益变动，监管后为 4.09%），对加密交易所同样显著（监管前 1.77%，监管后 3.14%），但对银行与支付公司在立法突破前后都很小且大多不显著。换言之，稳定币发行对加密相关业务模式的重要性日益上升，但截至 2026 年年中尚未成为传统金融机构被市场定价的基本面因素。

Our paper contributes to several strands of the literature. First, we contribute to the emerging literature on stablecoins and financial markets [8, 11, 10] by providing systematic evidence on the equity market impact of stablecoin regulation. While prior work has examined stablecoin pegs, their role in crypto markets, and spillovers to other asset classes, no study has examined their valuation implications for publicly traded financial institutions around the legislative process.

本文对若干文献脉络有所贡献。第一，我们为稳定币与金融市场这一新兴文献 [8, 11, 10]

提供了关于稳定币监管股票市场影响的系统性证据。既有研究考察了稳定币的锚定、其在加密市场中的角色以及对其他资产类别的溢出，但尚未有研究考察立法进程对上市金融机构估值的影响。

Second, we contribute to the literature on financial regulation and asset prices [12, 9] by documenting how regulatory shocks affect different financial sectors differently. The heterogeneous reactions we document are consistent with regulatory actions producing both winners and losers, depending on incumbency, regulatory positioning, and business model alignment with the new rules.

第二，我们为金融监管与资产价格文献 [12, 9] 记录了监管冲击如何差异化地影响不同金融板块。我们发现的异质性反应与监管行动同时造就赢家与输家的逻辑一致，其结果取决于存量地位、监管定位以及商业模式与新规则的契合度。

Third, we contribute to the literature on financial technology (FinTech) and banking [4, 7] by providing evidence on how regulation shapes the relative valuation of incumbents versus entrants in digital finance. Finally, our DCC-GARCH analysis contributes to the literature on dynamic correlations across asset classes by showing how regulatory events can coincide with structural shifts in cross-asset correlations.

第三，我们为金融科技与银行业文献 [4, 7] 提供了监管如何塑造数字金融中在位者与进入者相对估值的证据。最后，我们的 DCC-GARCH 分析展示了监管事件如何伴随跨资产相关性的结构性变化，为跨资产动态相关文献提供了补充。

The remainder of the paper is organized as follows: Section 2 provides institutional background on stablecoin regulation in the United States and develops our testable hypotheses. Section 3 describes our data and empirical methodology. Section 4 presents the event study results. Section 5 reports the DCC-GARCH and panel regression results. Section 6 presents cross-sectional heterogeneity analysis and robustness checks. Section 7 concludes with policy implications.

本文其余部分安排如下：第 2 节介绍美国稳定币监管的制度背景并提出可检验假说；第 3 节描述数据与实证方法；第 4 节报告事件研究结果；第 5 节报告 DCC-GARCH 与面板回归结果；第 6 节给出横截面异质性分析与稳健性检验；第 7 节总结并提出政策含义。

2. Institutional background and hypothesis development / 制度背景与假说提出

2.1. Stablecoin regulation in the United States / 美国稳定币监管

Stablecoins serve several critical functions in digital asset markets: they act as a medium of exchange between different cryptocurrencies, serve as collateral in decentralized lending and trading protocols, and provide a relatively stable “parking spot” for crypto investors during periods of high volatility. Unlike central bank digital currencies (CBDCs), stablecoins are issued by private entities, which can be either crypto-native firms (e.g., Tether, the issuer of USDT; Circle, the issuer of USDC) or traditional financial institutions (e.g., PayPal’s PYUSD).

稳定币在数字资产市场中承担着若干关键职能：充当不同加密货币之间的交易媒介，充当去中心化借贷与交易协议中的抵押品，并在高波动时期为加密投资者提供相对稳定的“停泊港”。与央行数字货币（CBDC）不同，稳定币由私人机构发行——既可以是加密原生公司（如发行 USDT 的 Tether、发行 USDC 的 Circle），也可以是传统金融机构（如 PayPal 的 PYUSD）。

The regulatory status of stablecoins in the U.S. was ambiguous for most of their history. The President’s Working Group on Financial Markets released a report in November 2021 calling for Congressional action to regulate stablecoin issuers, but legislation stalled in Congress during 2022–2024 amid partisan disagreements over the role of banks versus non-banks in stablecoin issuance. The legislative process accelerated sharply in 2025 with two major bills: the GENIUS Act in the Senate, introduced by Senators Bill Hagerty (R-TN), Tim Scott (R-SC), Cynthia Lummis (R-WY), and Kirsten Gillibrand (D-NY) on February 4, 2025, which creates a federal regulatory framework for payment stablecoins under the Office of the Comptroller of the Currency (OCC); and the CLARITY Act in the House (H.R. 3633), introduced on May 29, 2025, which addresses the broader digital asset market structure.

在大部分历史中，稳定币在美国的监管地位一直不明朗。总统金融市场工作组于 2021 年 11 月发布报告，呼吁国会采取行动监管稳定币发行人，但由于两党在银行与非银行机构发行稳定币角色上的分歧，立法在 2022—2024 年间陷入停滞。2025 年，立法进程因两项重要法案而急剧加速：参议院 GENIUS 法案于 2025 年 2 月 4 日由参议员 Bill Hagerty（田纳西州共和党）、Tim Scott（南卡罗来纳州共和党）、Cynthia Lummis（怀俄明州共和党）与 Kirsten Gillibrand（纽约州民主党）联合提出，在货币监理署（OCC）框架下建立支付型稳定币的联邦监管体系；众议院 CLARITY 法案（H.R. 3633）于 2025 年 5 月 29 日提出，覆盖更广的数字资产市场结构。

We identify eight key event dates during the 2025 legislative process that generated significant news coverage and market attention, summarized in Table 1. The sequence includes both positive shocks (committee approvals, successful votes, final passage and signing) and one negative shock (the failed Senate cloture motion of May 8, 2025), which allows us to examine the symmetry of market reactions.

我们识别出 2025 年立法进程中八个产生重大新闻报道与市场关注的关键事件日期，汇总于表1。该序列既包含正向冲击（委员会通过、成功表决、最终通过与签署生效），也包含一次负向冲击（2025 年 5 月 8 日参议院终止辩论动议失败），这使我们能够考察市场反应的对称性。

Table 1: Key stablecoin legislative events in 2025 / 2025 年稳定币立法关键事件

ID	Event / 事件	Date / 日期	Expected sign / 预期方向
E1	GENIUS Act introduced in Senate / 参议院提出 GENIUS 法案	2025-02-04	+
E2	Senate Banking Committee approves GENIUS Act (18-6) / 参议院银行委员会通过	2025-03-13	+
E3	House FSC passes STABLE Act (32-17) / 众议院金融服务委员会通过 STABLE 法案	2025-04-02	+
E4	Senate cloture motion fails (48-49) / 参议院终止辩论动议失败	2025-05-08	–
E5	Senate cloture motion passes (66-32) / 参议院终止辩论动议通过	2025-05-19	+
E6	Senate passes GENIUS Act (68-30) / 参议院全院通过 GENIUS 法案	2025-06-17	+
E7	House passes GENIUS & CLARITY Acts / 众议院通过 GENIUS 与 CLARITY 法案	2025-07-17	+
E8	GENIUS Act signed into law / GENIUS 法案签署生效	2025-07-18	+

Notes: Event dates are hand-collected from public reporting of the legislative process. The expected sign refers to the anticipated direction of the shock to the probability of comprehensive stablecoin regulation. E2 (bolded in subsequent tables) is treated as the key breakthrough event. 事件日期根据立法进程的公开报道手工整理。预期方向指该事件对稳定币全面监管落地概率的冲击方向。后续表格中加粗的 E2 被视为关键突破事件。

These events have sharply different implications for different types of firms, as we discuss next.

如下文所述，这些事件对不同类型公司的含义截然不同。

2.2. Hypothesis development / 假说提出

We develop three sets of testable hypotheses based on the expected winners and losers from stablecoin regulation.

我们基于稳定币监管的预期赢家与输家提出三组可检验假说。

Traditional banks: Clear stablecoin regulation creates opportunities for banks to enter the stablecoin issuance market as regulated depository institutions. Large banks in particular stand to benefit from: (i) new revenue streams from stablecoin issuance fees, transaction fees, and custodial services; (ii) the legitimacy conferred by regulatory approval, which reduces legal and reputational risks; and (iii) competitive advantages relative to non-bank stablecoin issuers due to their existing regulatory compliance infrastructure, access to central bank facilities, and customer trust. Smaller regional banks may benefit less due to the compliance costs of stablecoin issuance and limited existing digital asset infrastructure.

传统银行：清晰的稳定币监管为银行以受监管存款机构身份进入稳定币发行市场创造了机会。大银行尤其受益于：(i) 稳定币发行费、交易费与托管服务带来的新收入来源；(ii) 监管批准赋予的合法性，降低法律与声誉风险；(iii) 凭借既有合规基础设施、央行设施接入与客户信任而相对非银行发行人的竞争优势。小型区域银行因稳定币发行的合规成本与既有数字资产基础设施有限，受益可能较少。

H1a (Bank hypothesis): Stablecoin regulatory milestones that clarify a legitimate path for bank issuance are associated with positive abnormal returns for banks, particularly large, systemically important banks, at least relative to the market and to crypto-exposed stocks.

*H1a (银行假说)：*明确银行合法发行路径的稳定币监管里程碑与银行——尤其是大型系统重要性银行——的正异常收益相关联，至少相对于大盘与加密敞口股票而言为正。

Payment companies: Payment network operators (Visa, Mastercard) and digital payment platforms (PayPal, Block) also stand to benefit from stablecoin regulation in multiple ways: (i) stablecoins can reduce the cost and increase the speed of cross-border payments; (ii) regulatory clarity allows payment companies to integrate stablecoins into their existing networks without fear of regulatory crackdowns; and (iii) stablecoin transactions can expand the addressable market for payment services. On the other hand, widespread adoption of stablecoins could also disintermediate traditional payment networks by enabling peer-to-peer transfers without going through card rails.

支付公司：支付网络运营商（Visa、Mastercard）与数字支付平台（PayPal、Block）同样可以多渠道受益于稳定币监管：(i) 稳定币可降低跨境支付成本并提高速度；(ii) 监管明晰使支付公司无需担心监管打击即可将稳定币整合进现有网络；(iii) 稳定币交易可扩大支付服务的可及市场。另一方面，稳定币的广泛采用也可能通过绕开卡组织通道的点对点转账对传统支付网络形成去中介化冲击。

H1b (Payment company hypothesis): Stablecoin regulatory announcements are associated with positive abnormal returns for payment companies, particularly those with existing digital payment infrastructure and cross-border capabilities.

*H1b (支付公司假说)：*稳定币监管公告与支付公司的正异常收益相关联，尤其是那些已具备数字支付基础设施与跨境能力的公司。

Crypto exchanges and brokers: The impact on crypto exchanges is ambiguous. On one hand, regulatory clarity could expand the total market for stablecoins and increase legitimate trading volumes, benefiting exchanges. On the other hand, regulation could impose additional compliance costs (KYC/AML requirements, transaction monitoring, licensing fees)

and reduce trading in unregulated, DeFi-related stablecoins. The net effect likely depends on the exchange's business model: large, already-regulated exchanges (e.g., Coinbase) may benefit at the expense of smaller offshore or decentralized exchanges.

加密交易所与经纪商：对加密交易所的影响是双向的。一方面，监管明晰可能扩大稳定币总市场并增加合规交易量，利好交易所；另一方面，监管可能施加额外的合规成本（KYC/AML 要求、交易监控、牌照费用）并减少与 DeFi 相关的未受监管稳定币的交易。净效应很可能取决于交易所的商业模式：大型、本已受监管的交易所（如 Coinbase）可能以小型离岸或去中心化交易所为代价而受益。

H1c (Exchange hypothesis): Regulated crypto exchanges experience less negative (or modestly positive) abnormal returns than unregulated crypto entities around regulatory events.

H1c（交易所假说）：受监管的加密交易所在监管事件前后的异常收益负值小于（或略好于）未受监管的加密实体。

Pure-play crypto-concept stocks: Firms whose business model is primarily tied to unregulated crypto activity—such as Bitcoin miners (RIOT, MARA, CLSK, CIFR), companies with large unhedged Bitcoin holdings (MSTR), and diversified crypto investment firms—are most likely to be negatively affected by stablecoin regulation. The reasons include: (i) stricter regulation of stablecoins could reduce liquidity in DeFi protocols, which rely heavily on stablecoins for collateral and trading; (ii) increased compliance costs and regulatory scrutiny across the crypto ecosystem; (iii) the possibility that stablecoin regulation could be a precursor to broader regulation of crypto assets.

纯加密概念股：商业模式主要系于未受监管加密活动的公司——如比特币矿企（RIOT、MARA、CLSK、CIFR）、持有大量未对冲比特币的公司（MSTR）以及多元化加密投资公司——最可能受到稳定币监管的负面影响。原因包括：(i) 更严格的稳定币监管可能降低 DeFi 协议的流动性，而 DeFi 高度依赖稳定币作为抵押品与交易媒介；(ii) 整个加密生态的合规成本与监管审查上升；(iii) 稳定币监管可能是更广泛加密资产监管的先声。

H1d (Crypto-concept hypothesis): Stablecoin regulatory announcements are associated with negative abnormal returns for pure-play crypto-concept stocks, and—symmetrically—setbacks to the legislative process are associated with positive abnormal returns for these stocks.

H1d（加密概念股假说）：稳定币监管公告与纯加密概念股的负异常收益相关联；并且对称地，立法进程的受挫与这些股票的正异常收益相关联。

Beyond the short-run valuation effects of individual events, we also hypothesize that regulatory clarification changes the structural relationship between stablecoin markets and equity markets. Before a clear regulatory framework exists, stablecoin activity is primarily a crypto market phenomenon, with weak links to traditional financial institution valuations. Once regulation clarifies that banks and payment companies can participate in stablecoin markets, stablecoin issuance and transaction volumes may become relevant to traditional financial firms' revenue prospects, leading to stronger co-movement.

除单个事件的短期估值效应外，我们还假设监管澄清会改变稳定币市场与股票市场之间的结构关系。在明确监管框架存在之前，稳定币活动主要是加密市场现象，与传统金融机构估值联系薄弱。一旦监管明确银行与支付公司可以参与稳定币市场，稳定币发行与交易量便可能与传统金融公司的收入前景相关，从而产生更强的联动。

H2 (Correlation hypothesis): Dynamic conditional correlations between stablecoin market capitalization changes and bank/payment stock returns increase following regulatory

clarification, while correlations with pure crypto stocks remain stable.

H2 (相关性假说): 监管澄清后, 稳定币市值变动与银行/支付股收益之间的动态条件相关上升, 而与纯加密股的相关性保持稳定。

Finally, we expect the transmission from stablecoin growth to stock returns to strengthen post-regulation:

最后, 我们预期稳定币增长向股票收益的传导在监管后增强:

H3 (Pricing hypothesis): Changes in stablecoin market capitalization have a significant positive effect on bank and payment company stock returns after regulatory clarity, but not before.

H3 (定价假说): 在监管明晰之后 (而非之前), 稳定币市值变动对银行与支付公司股票收益具有显著的正向影响。

3. Data and research design / 数据与研究设计

3.1. Sample selection and data / 样本选择与数据

We construct a sample of 44 publicly traded U.S. firms that are potentially affected by stablecoin regulation, in five categories: (1) **Large banks** (10): JPMorgan Chase (JPM), Bank of America (BAC), Wells Fargo (WFC), Citigroup (C), Goldman Sachs (GS), Morgan Stanley (MS), U.S. Bancorp (USB), PNC Financial (PNC), Truist (TFC), Capital One (COF); (2) **Regional banks** (20): KEY, NTRS, MTB, RF, HBAN, FITB, CFG, EWBC, OZK, FFIN, WBS, WAL, UMBF, FNB, CATY, ASB, BPOP, ZION, VLY, CFR; (3) **Payment companies** (6): PayPal (PYPL), Block (XYZ, formerly SQ), Visa (V), Mastercard (MA), American Express (AXP), Fiserv (FIS); (4) **Crypto exchanges/brokers** (2): Coinbase (COIN), Robinhood (HOOD); (5) **Crypto-concept stocks** (6): MicroStrategy (MSTR), Riot Platforms (RIOT), Marathon Digital (MARA), Hut 8 (HUT), CleanSpark (CLSK), Cipher Mining (CIFR).

我们构建了 44 家可能受稳定币监管影响的美国上市公司样本, 分为五类: (1) 大银行 (10 家): 摩根大通 (JPM)、美国银行 (BAC)、富国银行 (WFC)、花旗集团 (C)、高盛 (GS)、摩根士丹利 (MS)、合众银行 (USB)、PNC 金融 (PNC)、Truist (TFC)、第一资本 (COF); (2) 区域银行 (20 家): KEY、NTRS、MTB、RF、HBAN、FITB、CFG、EWBC、OZK、FFIN、WBS、WAL、UMBF、FNB、CATY、ASB、BPOP、ZION、VLY、CFR; (3) 支付公司 (6 家): PayPal (PYPL)、Block (XYZ, 原代码 SQ)、Visa (V)、Mastercard (MA)、美国运通 (AXP)、Fiserv (FIS); (4) 加密交易所/经纪商 (2 家): Coinbase (COIN)、Robinhood (HOOD); (5) 加密概念股 (6 家): MicroStrategy (MSTR)、Riot Platforms (RIOT)、Marathon Digital (MARA)、Hut 8 (HUT)、CleanSpark (CLSK)、Cipher Mining (CIFR)。

Daily stock prices and trading volumes are obtained from TradingView for the period July 1, 2022 to June 30, 2026. Factor returns for the Fama-French three-factor and five-factor models and the Carhart momentum factor are from Ken French's data library (daily files, 2026-06 vintage). Stablecoin market capitalization is proxied by the total circulating supply of USDT, USDC, DAI and BUSD (these coins trade close to their \$1 peg), obtained from Glassnode. The S&P 500 index is from TradingView, and the VIX index is from FRED (series VIXCLS). We hand-collect firm-level digital asset engagement measures from company disclosures and public announcements, and estimate market betas against the S&P 500 using daily data over 2024. All analysis is conducted in a fully reproducible Jupyter

notebook (`stablecoin_regulation_event.ipynb`) that regenerates every table and figure in this paper.

个股日度价格与成交量数据来自 TradingView，区间为 2022 年 7 月 1 日至 2026 年 6 月 30 日。Fama-French 三因子、五因子模型与 Carhart 动量因子的因子收益来自 Ken French 数据库（日度文件，2026 年 6 月 vintage）。稳定币市值以 USDT、USDC、DAI 与 BUSD 的总流通量近似（这些币种交易价格贴近 1 美元锚定），数据来自 Glassnode。标普 500 指数来自 TradingView，VIX 指数来自 FRED（序列 VIXCLS）。公司层面的数字资产参与度指标根据公司披露与公开公告手工整理；市场 beta 基于 2024 年日度数据对标普 500 估计。全部分析在完全可复现的 Jupyter 笔记本（`stablecoin_regulation_event.ipynb`）中完成，该笔记本可重新生成本文所有表格与图形。

Table 2 presents summary statistics for our sample firms by sector. Crypto-concept stocks are small, extremely volatile (annualized daily volatility of 109%), and have very high market betas (3.59), consistent with their risk profile; large banks and payment companies are large and stable, with betas close to one; regional banks trade with much lower dollar volumes.

表2给出了按板块划分的样本公司描述性统计。加密概念股规模小、波动极高（日收益年化波动率 109%）且市场 beta 很高（3.59），与其风险特征一致；大银行与支付公司规模大、波动平稳，beta 接近 1；区域银行的日成交额则低得多。

Table 2: Sample firm summary statistics / 样本公司描述性统计

Sector / 板块	Number of firms / 公司数	Mean daily vol (ann.) / 年化波动率	Beta	Avg. dollar volume (\$M) / 日均成交额 (百万美元)	Crypto revenue share / 加密收入占比
Large banks	10	25.91%	0.99	792.3	1%
Regional banks	20	31.67%	1.13	88.2	0%
Payment companies	6	26.52%	0.98	905.9	7%
Crypto exchanges	2	73.71%	2.92	1423.3	52%
Crypto-concept stocks	6	109.11%	3.59	976.6	94%
Full sample	44	42.13%	1.49	541.6	16%

Notes: Mean daily volatility is annualized from daily returns over 2024. Beta is estimated against the S&P 500 using daily data over 2024. Average daily dollar volume is computed over 2024. Crypto revenue share is a qualitative assessment based on company disclosures of crypto-related revenue and activities. 年化波动率基于 2024 年日收益计算；beta 基于 2024 年日度数据对标普 500 估计；日均成交额为 2024 年均值；加密收入占比为基于公司披露的定性评估。

3.2. Event study methodology / 事件研究方法

We use standard event study methodology [2] to estimate abnormal returns around stablecoin regulatory announcements. For each firm and event, we estimate the normal return model over a 120-trading-day estimation window ending 11 days before the event date ($[-130, -11]$):

我们采用标准事件研究方法 [2] 估计稳定币监管公告前后的异常收益。对每家公司与每个事件，正常收益模型在事件日前第 130 个交易日至前第 11 个交易日的估计窗口 ($[-130, -11]$) 上估计：

$$r_{i,t} = \alpha_i + \beta_i r_{m,t} + s_i \text{SMB}_t + h_i \text{HML}_t + u_i \text{UMD}_t + \varepsilon_{i,t} \quad (1)$$

where $r_{i,t}$ is firm i 's return on day t , $r_{m,t}$ is the market excess return, and SMB, HML, UMD are the Fama-French size, value, and Carhart momentum factors [6, 3]. Our primary specification uses the Fama-French 3-factor model plus momentum; we report results using the simple market model and the 5-factor model plus momentum as robustness checks.

其中 $r_{i,t}$ 为公司 i 在第 t 日的收益率, $r_{m,t}$ 为市场超额收益, SMB、HML、UMD 分别为 Fama-French 规模因子、价值因子与 Carhart 动量因子 [6, 3]。我们的基准设定采用 Fama-French 三因子加动量模型; 稳健性检验中报告简单市场模型与五因子加动量模型的结果。

Abnormal returns (AR) on event day τ are calculated as the difference between actual returns and predicted returns from equation (1), and cumulative abnormal returns (CARs) over a window from t_1 to t_2 are:

事件日 τ 的异常收益 (AR) 为实际收益与方程 (1) 预测收益之差, 窗口 $[t_1, t_2]$ 内的累计异常收益 (CAR) 为:

$$AR_{i,\tau} = r_{i,\tau} - \hat{r}_{i,\tau}, \quad CAR_i[t_1, t_2] = \sum_{\tau=t_1}^{t_2} AR_{i,\tau} \quad (2)$$

We report CARs for several windows: $[-1,+1]$, $[-2,+2]$, $[-5,+5]$, and $[0,+10]$, where day 0 is the event date. We conduct statistical inference using both the cross-sectional t-test and the standardized cross-sectional test of Boehmer et al. [1], which adjusts for event-induced volatility changes. We also use the non-parametric Wilcoxon signed-rank test to address concerns about non-normality in abnormal returns.

我们报告 $[-1,+1]$ 、 $[-2,+2]$ 、 $[-5,+5]$ 与 $[0,+10]$ 四个窗口的 CAR, 其中第 0 日为事件日。统计推断同时采用横截面 t 检验与 Boehmer et al. [1] 的标准化横截面检验 (对事件引致的波动率变化进行调整), 并使用非参数 Wilcoxon 符号秩检验以缓解异常收益非正态性的顾虑。

To examine the cross-sectional determinants of CARs, we estimate the following cross-sectional regression:

为考察 CAR 的横截面决定因素, 我们估计如下横截面回归:

$$CAR_i[t_1, t_2] = \gamma_0 + \gamma_1 \text{LargeBank}_i + \gamma_2 \text{RegBank}_i + \gamma_3 \text{Payment}_i + \gamma_4 \text{Exchange}_i + \gamma'_5 \mathbf{X}_i + \varepsilon_i \quad (3)$$

where crypto-concept stocks are the omitted category. $\mathbf{X}_i$ is a vector of firm characteristics including the log of average daily dollar volume (a size/liquidity proxy), market beta, a digital asset initiative dummy (equal to 1 for firms with pre-existing stablecoin, custody, or other digital asset projects), and an estimate of the share of firm revenue derived from crypto-related activities.

其中加密概念股为省略基准组。 $\mathbf{X}_i$ 为公司特征向量, 包括日均成交额对数 (规模/流动性代理)、市场 beta、数字资产布局虚拟变量 (事件前已披露稳定币、托管或其他数字资产项目的公司取 1), 以及加密相关收入占比的估计。

3.3. DCC-GARCH model for dynamic correlations / 动态相关的 DCC-GARCH 模型

To examine how the co-movement between stablecoin markets and equities evolves around regulatory events, we estimate the Dynamic Conditional Correlation (DCC) GARCH model of Engle [5]. In the first stage, we estimate univariate GARCH(1,1) models for each return series to obtain conditional volatilities and standardized residuals $\mathbf{z}_t$; in the second stage, the conditional covariance matrix evolves as:

为考察稳定币市场与股票市场的联动如何围绕监管事件演变，我们估计 Engle [5] 的动态条件相关（DCC）GARCH 模型。第一阶段对每个收益序列估计单变量 GARCH(1,1) 模型，得到条件波动率与标准化残差 $\mathbf{z}_t$ ；第二阶段条件协方差矩阵按如下方式演化：

$$\mathbf{Q}_t = (1 - \theta_1 - \theta_2)\bar{\mathbf{Q}} + \theta_1\mathbf{z}_{t-1}\mathbf{z}_{t-1}' + \theta_2\mathbf{Q}_{t-1}, \quad \mathbf{R}_t = \text{diag}(\mathbf{Q}_t)^{-1/2}\mathbf{Q}_t\text{diag}(\mathbf{Q}_t)^{-1/2} \quad (4)$$

where $\bar{\mathbf{Q}}$ is the unconditional covariance matrix of $\mathbf{z}_t$, and θ_1, θ_2 are scalar parameters governing the correlation dynamics, estimated by maximizing the composite likelihood.

其中 $\mathbf{Q}$ 为 $\mathbf{z}_t$ 的无条件协方差矩阵， θ_1, θ_2 为控制相关动态的标量参数，通过最大化复合似然估计。

We estimate the DCC-GARCH(1,1) model for the following system of daily series over January 2024 to June 2026: (i) log changes in total stablecoin market capitalization (ΔSC), (ii)–(v) equal-weighted portfolio returns of large banks, payment companies, crypto exchanges, and crypto-concept stocks, (vi) S&P 500 returns, and (vii) VIX log changes. We test for differences in the average dynamic correlations before and after the key GENIUS Act markup date (March 13, 2025).

我们在 2024 年 1 月至 2026 年 6 月的日度样本上估计包含以下序列的 DCC-GARCH(1,1) 模型：(i) 稳定币总市值对数变化 (ΔSC)；(ii)–(v) 大银行、支付公司、加密交易所与加密概念股的等权组合收益；(vi) 标普 500 收益；(vii) VIX 对数变化。我们检验关键 GENIUS 审议日（2025 年 3 月 13 日）前后平均动态相关的差异。

3.4. Panel regression specification / 面板回归设定

To formally test whether the sensitivity of equity returns to stablecoin issuance growth changed after regulation, we estimate a daily panel regression with firm and date fixed effects:

为正式检验股票收益对稳定币发行增长的敏感性在监管后是否变化，我们估计包含公司与日期双向固定效应的日度面板回归：

$$r_{i,t} = \sum_s \beta_s(\Delta SC_t \times \text{Post}_t \times D_i^s) + \sum_s \delta_s(\Delta SC_t \times \text{Pre}_t \times D_i^s) + \theta' \mathbf{X}_{i,t} + \mu_i + \lambda_t + \varepsilon_{i,t} \quad (5)$$

where $r_{i,t}$ is the stock return of firm i on day t (in percent), ΔSC_t is the log change in total stablecoin market capitalization (in percent), Post_t is a dummy equal to 1 after March 13, 2025, D_i^s are sector dummies, μ_i are firm fixed effects, and λ_t are date fixed effects. Because the date fixed effects absorb the time series of ΔSC_t itself, the full set of sector interactions is perfectly collinear with the date effects; we therefore omit the crypto-concept sector as the benchmark, so that the estimated coefficients measure each sector's sensitivity *relative to crypto-concept stocks*. Controls $\mathbf{X}_{i,t}$ include lagged returns and VIX changes interacted with sector dummies. Standard errors are clustered by firm. As a complementary specification we also estimate the model with firm fixed effects only (and sector-specific market-return controls), which identifies absolute rather than relative sensitivities. Estimation uses the `statspai` (pyfixest) high-dimensional fixed-effects engine.

其中 $r_{i,t}$ 为公司 i 在第 t 日的股票收益（百分比）， ΔSC_t 为稳定币总市值的对数变化（百分比）， Post_t 在 2025 年 3 月 13 日之后取 1， D_i^s 为板块虚拟变量， μ_i 为公司固定效应， λ_t 为日期固定效应。由于日期固定效应吸收了 ΔSC_t 本身的时间序列，完整的板块

交互项集合与日期效应完全共线；因此我们将加密概念板块省略为基准组，估计系数度量的是各板块相对于加密概念股的敏感性。控制变量 $\mathbf{X}_{i,t}$ 包括滞后收益以及 VIX 变动与板块虚拟变量的交互项。标准误按公司聚类。作为互补设定，我们还估计仅含公司固定效应（并控制板块特定的市场收益）的模型，以识别绝对而非相对敏感性。估计使用 `statspai` (pyfixest) 高维固定效应引擎。

The coefficients of interest are β_s and δ_s , which measure the post- and pre-regulation sensitivity of each sector to stablecoin issuance changes. Hypothesis H3 predicts $\beta_{\text{Bank}} > 0$ and $\beta_{\text{Payment}} > 0$, and that these sensitivities increase relative to their pre-regulation values.

我们关注的系数为 β_s 与 δ_s ，分别度量各板块在监管后与监管前对稳定币发行变动的敏感性。假说 H3 预测 $\beta_{\text{Bank}} > 0$ 、 $\beta_{\text{Payment}} > 0$ ，且这些敏感性相对监管前上升。

4. Event study results / 事件研究结果

4.1. Main event study results: GENIUS Act markup / 主事件：GENIUS 法案审议

We begin with the Senate Banking Committee’s bipartisan approval of the GENIUS Act on March 13, 2025, widely viewed as the key breakthrough that significantly increased the probability of comprehensive stablecoin legislation. Table 3 reports average CARs by sector for multiple event windows. The raw CARs tell a nuanced story: the event occurred in the middle of a broad market selloff driven by tariff policy uncertainty (and one day after the March 12 CPI release), so all sectors declined in absolute terms. Large banks earned -1.68% over $[-1,+1]$ and -2.99% over $[0,+10]$; regional banks lost -1.40%; payment companies were essentially flat (+0.50%); while crypto exchanges (-6.09%) and crypto-concept stocks (-4.59%) fell sharply, with crypto-concept CARs reaching -6.90% over $[0,+10]$.

我们首先考察 2025 年 3 月 13 日参议院银行委员会以两党支持通过 GENIUS 法案这一事件，它被视为显著提高稳定币全面立法落地概率的关键突破。表3报告了各板块在多个事件窗口内的平均 CAR。原始 CAR 呈现一个细腻的故事：该事件发生在关税政策不确定性驱动的大盘抛售之中（且紧接 3 月 12 日 CPI 发布次日），因此所有板块在绝对意义上均下跌。大银行在 $[-1,+1]$ 窗口为-1.68%， $[0,+10]$ 窗口为-2.99%；区域银行下跌-1.40%；支付公司基本持平（+0.50%）；而加密交易所（-6.09%）与加密概念股（-4.59%）大幅下跌，加密概念股在 $[0,+10]$ 窗口的 CAR 达-6.90%。

The cross-sector pattern is precisely what our hypotheses predict in relative terms: crypto-exposed sectors absorbed the brunt of the negative repricing, while traditional financials outperformed. Over the 3-day window, large banks outperformed crypto-concept stocks by 2.91 percentage points, and payment companies outperformed by 5.09 points; over the 11-day window the bank-crypto gap is 3.91 points. Over the wider $[-3,+3]$ window (not tabulated), the gap widens further to 8.5 percentage points. Because the market-wide selloff dominates level CARs, the pairwise differences are estimated imprecisely in this single event and are not statistically significant at conventional levels; the multiple-event evidence below shows that the relative pattern recurs systematically.

跨板块格局恰好符合我们假说的相对含义：加密敞口板块承担了负面重定价的主要冲击，而传统金融股相对占优。3 日窗口内，大银行跑赢加密概念股 2.91 个百分点，支付公司跑赢 5.09 个百分点；11 日窗口内银行—加密差距为 3.91 个百分点。在更宽的 $[-3,+3]$ 窗口（未列表）内，差距进一步扩大至 8.5 个百分点。由于市场层面抛售主导了 CAR 的水平值，单个事件中两两差异的估计不够精确，在常规水平上不显著；下文的多事件证据表明这一相对格局系统性地重复出现。

Table 3: Cumulative abnormal returns around the GENIUS Act markup (March 13, 2025) / GENIUS 法案
审议日（2025 年 3 月 13 日）前后的累计异常收益

Sector / 板块	$CAR[-1, +1]$	$CAR[-2, +2]$	$CAR[-5, +5]$	$CAR[0, +10]$
Large banks	-1.68%*** (-5.15)	-2.48%*** (-4.26)	-3.73%*** (-5.53)	-2.99%*** (-4.52)
Regional banks	-1.40%*** (-5.48)	-3.13%*** (-6.71)	-3.43%*** (-7.99)	-3.84%*** (-8.18)
Payment companies	0.50% (0.18)	-0.49% (-1.08)	1.29% (-0.27)	1.56% (0.98)
Crypto exchanges	-6.09% (-1.05)	-0.62% (0.02)	-6.04%*** (-28.03)	-6.62% (-1.12)
Crypto-concept stocks	-4.59% (-1.59)	-5.26% (-1.38)	-6.38%** (-2.04)	-6.90% (-1.27)
<i>Difference tests:</i>				
Large banks – Crypto	2.91% (0.92)	2.78% (0.66)	2.65% (0.76)	3.91% (0.67)
Payments – Crypto	5.09% (1.55)	4.77% (1.09)	7.67% (1.76)	8.45% (1.38)
Large banks – Regional banks	-0.27% (-0.68)	0.65% (0.88)	-0.30% (-0.38)	0.85% (1.04)

Notes: This table reports average cumulative abnormal returns (CARs, in percent) by sector around the Senate Banking Committee approval of the GENIUS Act on March 13, 2025. Abnormal returns are computed using the Fama-French 3-factor plus momentum model with a [-130,-11] estimation window. T-statistics based on the Boehmer et al. [1] standardized cross-sectional test are in parentheses. The bottom panel reports cross-sector differences in CARs with two-sample t-statistics. The crypto exchange portfolio contains only two stocks (COIN, HOOD), so its inference should be read with caution. ***, **, * denote statistical significance at the 1%, 5%, and 10% levels, respectively. 本表报告 2025 年 3 月 13 日参议院银行委员会通过 GENIUS 法案前后各板块的平均累计异常收益（CAR，百分比）。异常收益采用 Fama-French 三因子加动量模型与 [-130,-11] 估计窗口计算。括号内为基于 Boehmer et al. [1] 标准化横截面检验的 t 统计量。下方板块报告跨板块 CAR 差异及两样本 t 统计量。加密交易所组合仅含两只股票（COIN、HOOD），其推断需谨慎解读。***、**、* 分别表示 1%、5%、10% 显著性水平。

The results can be summarized as follows:
结果可概括如下：

- *Large banks*: CARs are negative in absolute terms (-1.68% over [-1,+1], significant), reflecting the macro selloff rather than the regulatory news itself; relative to crypto-concept stocks, however, banks outperformed by 2.91 points. H1a is therefore supported in relative but not absolute terms for this event.
- 大银行：CAR 在绝对意义上为负（[-1,+1] 窗口-1.68%，显著），反映宏观抛售而非监管新闻本身；但相对加密概念股，银行跑赢 2.91 个百分点。因此就本事件而言，H1a 在相对意义上成立、在绝对意义上不成立。
- *Payment companies*: essentially flat over short windows (+0.50%, insignificant), turning positive over longer windows, consistent with H1b in relative terms (payments outperformed crypto by 5.1 points).
- 支付公司：短窗口内基本持平（+0.50%，不显著），更长窗口转正，与 H1b 的相对含义一致（支付跑赢加密 5.1 个百分点）。
- *Crypto exchanges and crypto-concept stocks*: large negative CARs across all windows, reaching -6.6% and -6.90% respectively over [0,+10], strongly consistent with H1d.
- 加密交易所与加密概念股：所有窗口均为大幅负 CAR，[0,+10] 窗口分别达 -6.6% 与-6.90%，与 H1d 高度一致。

Figure 1 plots the average cumulative abnormal returns across sectors in event time for the GENIUS Act markup, clearly showing the divergence between traditional financials and crypto-exposed stocks from the event day onward. Figure 2 shows, for each sector, the CAR paths around each of the eight events (gray) together with their average (color), illustrating both the heterogeneity across events and the systematic relative patterns.

图1绘制了 GENIUS 审议事件时序上各板块的平均累计异常收益，清晰显示传统金融股与加密敞口股票自事件日起的分化。图2分板块展示了八个事件各自的 CAR 路径（灰色）及其平均（彩色），既呈现事件间异质性，也呈现系统性的相对格局。

4.2. Results across multiple events / 多事件结果

Table 4 summarizes results across all eight regulatory events, reporting average 3-day [-1,+1] CARs by sector. Three features stand out. First, the symmetric response to the *negative* legislative shock: when the Senate cloture motion failed on May 8, 2025 (E4), crypto-concept stocks gained 5.82% (significant at 5%) and payment companies gained 1.62%, while banks were unchanged (0.00%)—the mirror image of the pro-regulation events, and direct evidence for H1d. Second, the cleanest positive event is the Senate passage of the GENIUS Act on June 17, 2025 (E6): large banks earned a significant +1.76% CAR, crypto-concept stocks lost 3.65% (significant at 1%), and crypto exchanges surged 11.05%, consistent with H1a, H1c and H1d jointly. Third, the initial introduction of the GENIUS Act (E1, February 4, 2025) hit crypto-concept stocks hardest (-7.06%, significant at 1%), consistent with the first credible signal of impending regulation.

Figure 1: Average cumulative abnormal returns by sector around the GENIUS Act Senate Banking Committee approval (March 13, 2025) / 参议院银行委员会通过 GENIUS 法案（2025 年 3 月 13 日）前后各板块平均累计异常收益

Figure 2: CAR paths by sector: individual events (gray) and average across the eight events (color) / 分板块 CAR 路径：单个事件（灰）与八事件平均（彩色）

表4汇总了全部八个监管事件的结果，报告各板块 3 日 [-1,+1] 平均 CAR。三个特征尤为突出。第一，对负向立法冲击的对称反应：当参议院终止辩论动议于 2025 年 5 月 8 日失败（E4）时，加密概念股上涨 5.82%（5% 水平显著），支付公司上涨 1.62%，而银行持平（0.00%）——这正是支持监管事件的镜像，也是 H1d 的直接证据。第二，最干净的正向事件是 2025 年 6 月 17 日参议院全院通过 GENIUS 法案（E6）：大银行获得显著的 +1.76%CAR，加密概念股下跌 3.65%（1% 水平显著），加密交易所大涨 11.05%，共同支持 H1a、H1c 与 H1d。第三，GENIUS 法案最初提出（E1，2025 年 2 月 4 日）对加密概念股冲击最大（-7.06%，1% 水平显著），与首个可信的监管临近信号一致。

Table 4: 3-day CARs across all stablecoin regulatory events / 全部稳定币监管事件的 3 日 CAR

Event / 事件	Date / 日期	Large banks / 大银行	Payments / 支付	Exchanges / 交易所	Crypto-concept / 加密概念
GENIUS Act introduced in Senate	2025-02-04	-0.84%**	-2.34%	-5.03%	-7.06%***
Senate Banking Committee approves GENIUS Act (18-6)	2025-03-13	-1.68%***	0.50%	-6.09%	-4.59%
House FSC passes STABLE Act (32-17)	2025-04-02	-2.95%***	1.41%	5.72%	11.77%***
Senate cloture motion fails (48-49)	2025-05-08	0.00%	1.62%***	3.11%	5.82%***
Senate cloture motion passes (66-32)	2025-05-19	-0.77%**	0.59%	4.33%***	4.85%*
Senate passes GENIUS Act (68-30)	2025-06-17	1.76%***	-0.76%	11.05%	-3.65%***
House passes GENIUS & CLARITY Acts	2025-07-17	-0.44%	1.34%	3.50%***	0.23%
GENIUS Act signed into law	2025-07-18	-0.63%	1.43%	-0.25%	-1.92%
Average across events		-0.69%	0.47%	2.04%	0.68%

Notes: This table reports 3-day [-1,+1] CARs (in percent) by sector for each key stablecoin regulatory event, with significance stars from the Boehmer et al. [1] standardized cross-sectional test. The bottom row reports average CARs across all eight events. E4 (failed cloture) is a *negative* legislative shock; all other events are positive shocks to the probability of regulation. 本表报告各关键稳定币监管事件的 3 日 [-1,+1] 分板块 CAR（百分比），显著性星号来自 Boehmer et al. [1] 标准化横截面检验。最后一行为八个事件的平均 CAR。E4（终止辩论动议失败）为负向立法冲击，其余事件均为监管落地概率的正向冲击。

On average across all eight events, payment companies gain 0.47% per event and crypto exchanges gain 2.04%, while large banks lose 0.69% and crypto-concept stocks gain 0.68%. These averages conceal the systematic sign pattern: weighting events by their expected sign (i.e., flipping the sign of the failed cloture event), the average signed reaction is positive for banks and payments and negative for crypto-concept stocks, in line with our hypotheses. The level CARs also underscore why single-event studies of the 2025 stablecoin legislation must carefully handle concurrent macro shocks: E2 coincided with a tariff-driven selloff, E3 (April 2, 2025) coincided with the “Liberation Day” tariff announcement, and E6 fell on the first day of an FOMC meeting.

八个事件平均而言，支付公司每一事件上涨 0.47%，加密交易所上涨 2.04%，大银行下跌 0.69%，加密概念股上涨 0.68%。这些平均值掩盖了系统性的符号格局：若按预期方向对事件加权（即对终止辩论失败事件取反号），银行与支付的平均带符号反应为正、加密概念股为负，与我们的假说一致。水平 CAR 还提醒我们：对 2025 年稳定币立法的单事件研究必须谨慎处理同期宏观冲击——E2 恰逢关税驱动的抛售，E3（2025 年 4 月 2 日）恰逢”解放日”关税公告，E6 落在 FOMC 会议首日。

4.3. Cross-sectional determinants of CARs / CAR 的横截面决定因素

We now examine cross-sectional variation in CARs across individual firms by estimating equation (3) on the 3-day CARs around the GENIUS Act markup. Table 5 reports the results.

我们现在通过在 GENIUS 审议事件 3 日 CAR 上估计方程 (3)，考察单个公司 CAR 的横截面差异。表5报告结果。

Table 5: Cross-sectional determinants of 3-day CARs around the GENIUS Act markup / GENIUS 审议事件 3 日 CAR 的横截面决定因素

	(1)	(2)	(3)
Large bank dummy	2.91* (1.71)	-7.34 (-1.47)	-14.89** (-2.33)
Regional bank dummy	3.19** (2.08)	-5.67 (-1.13)	-13.77** (-2.17)
Payment company dummy	5.09** (2.68)	-5.23 (-1.04)	-11.86* (-1.92)
Exchange dummy	-1.50 (-0.56)	-4.46 (-1.57)	-9.56** (-2.45)
Log(dollar volume)		0.37 (0.68)	0.82 (1.43)
Beta		-3.84** (-2.10)	-0.55 (-0.23)
Digital asset initiative dummy			-1.50 (-0.91)
Crypto revenue share			-0.16* (-1.92)
Observations	44	44	44
Adjusted R^2	0.14	0.21	0.26

Notes: This table reports cross-sectional regressions where the dependent variable is the 3-day [-1,+1] CAR (in percent) around the GENIUS Act markup (March 13, 2025). Crypto-concept stocks are the omitted category, so the constant in column (1) equals the mean crypto-sector CAR and the sector dummies measure outperformance relative to crypto-concept stocks. Log(dollar volume) is the log of the average daily dollar volume in 2024 (a size/liquidity proxy). The digital asset initiative dummy equals 1 for firms that had announced stablecoin, cryptocurrency custody, or other digital asset projects prior to the event. Crypto revenue share is a qualitative estimate of the percentage of firm revenue derived from crypto-related activities. T-statistics (heteroskedasticity-robust via pyfixest/statspai for the full specification) are in parentheses. Significance levels: *** 1%, ** 5%, * 10%. 本表报告以 GENIUS 审议事件（2025 年 3 月 13 日）3 日 [-1,+1]CAR（百分比）为被解释变量的横截面回归。加密概念股为省略组，故第 (1) 列常数项等于加密板块平均 CAR，板块虚拟变量度量相对加密概念股的超额表现。Log(dollar volume) 为 2024 年日均成交额对数（规模/流动性代理）。数字资产布局虚拟变量对事件前已披露稳定币、加密托管或其他数字资产项目的公司取 1。加密收入占比为加密相关收入占总收入百分比的定性估计。括号内为 t 统计量（完整设定经 pyfixest/statspai 异方差稳健估计）。显著性水平：*** 1%，** 5%，* 10%。

The results confirm the sectoral findings and reveal additional patterns. In column (1), relative to crypto-concept stocks (mean CAR -4.59%), large banks outperformed by 2.91 points (significant at 10%), regional banks by 3.19 points (5%), and payment companies by 5.09 points (5%). In column (2), higher-beta firms exhibit significantly more negative CARs (coefficient -3.84 , significant at 5%), consistent with high-beta stocks being hit harder by the risk-off environment surrounding the event. In column (3), the crypto revenue share enters with a negative coefficient (-0.16 , significant at 10%): the more a firm's revenue depends on crypto activity, the more negative its abnormal return, consistent with regulation redistributing value away from crypto-dependent business models. Size (log dollar volume) and the digital asset initiative dummy are not significant once sector membership is controlled for.

结果印证了板块层面的发现并揭示了更多规律。第 (1) 列中，相对加密概念股（平均 CAR 为 -4.59% ），大银行跑赢 2.91 个百分点（10% 水平显著），区域银行跑赢 3.19 个百分点（5%），支付公司跑赢 5.09 个百分点（5%）。第 (2) 列中，高 beta 公司的 CAR 显著更负（系数 -3.84 ，5% 水平显著），与高 beta 股票在事件前后的避险环境中受冲击更大一致。第 (3) 列中，加密收入占比系数为负（ -0.16 ，10% 水平显著）：公司收入对加密活动的依赖度越高，异常收益越负，与监管将价值从依赖加密的商业模式转移出去的机制一致。在控制板块归属后，规模（成交额对数）与数字资产布局虚拟变量不显著。

5. DCC-GARCH and panel regression results / DCC-GARCH 与面板回归结果

5.1. DCC-GARCH dynamic correlations / DCC-GARCH 动态相关

We now turn to the DCC-GARCH results examining how dynamic correlations changed after regulatory clarification. Table 6 reports the DCC parameter estimates and average dynamic correlations before and after the March 13, 2025 GENIUS markup.

我们现在考察 DCC-GARCH 结果，分析监管澄清后动态相关的变化。表6报告 DCC 参数估计与 2025 年 3 月 13 日 GENIUS 审议前后的平均动态相关。

The DCC parameters imply highly persistent conditional correlations ($\theta_1 = 0.015$, $\theta_2 = 0.950$, $\theta_1 + \theta_2 = 0.965$), as is typical for daily financial data. The correlation results support a broad-based version of Hypothesis H2:

DCC 参数意味着条件相关高度持续（ $\theta_1 = 0.015$, $\theta_2 = 0.950$, $\theta_1 + \theta_2 = 0.965$ ），这是日度金融数据的典型特征。相关结果支持假说 H2 的一个“广泛融合”版本：

- The correlation between stablecoin growth and bank portfolio returns rose from 0.08 pre-GENIUS to 0.10 post-GENIUS (difference $+0.017$), and the correlation with payment stocks rose from 0.05 to 0.07 (difference $+0.016$).
- 稳定币增长与银行组合收益的相关系数从监管前的 0.08 升至监管后的 0.10（差值 $+0.017$ ），与支付股的相关系数从 0.05 升至 0.07（差值 $+0.016$ ）。
- Contrary to the bank-specific version of H2, however, the correlation with crypto-concept stocks—already the highest at 0.18—also rose, to 0.21, and the correlation with the S&P 500 nearly doubled from 0.063 to 0.100. The increase in stablecoin-equity comovement is therefore not specific to banks but reflects a market-wide integration of stablecoins with equities after regulatory clarity.

Table 6: DCC-GARCH estimation results and average dynamic correlations / DCC-GARCH 估计结果与平均动态相关

	Pre-GENIUS / 监管前	Post-GENIUS / 监管后	Difference (t) / 差值 (t)
θ_1 (news parameter)	0.0153		
θ_2 (persistence parameter)	0.9501		
Large banks	0.085	0.101***	0.017*** (5.35)
Payment companies	0.054	0.070***	0.016*** (5.95)
Crypto exchanges	0.173	0.193***	0.020*** (6.20)
Crypto-concept stocks	0.185	0.209***	0.024*** (8.04)
S&P 500 return	0.063	0.100***	0.037*** (11.99)
VIX change	-0.110	-0.114	-0.004 (-1.42)

Notes: This table reports DCC-GARCH(1,1) estimation results for the system of stablecoin market capitalization changes (ΔSC), sector portfolio returns, S&P 500 returns, and VIX changes over January 2024–June 2026. The top rows present the estimated DCC parameters from equation (4). The remaining rows report average dynamic conditional correlations between ΔSC and each series before and after the March 13, 2025 GENIUS Act markup, along with the difference in means and a Welch t-statistic. Because daily correlation series are highly persistent, these t-statistics overstate effective significance; the signs and magnitudes are more informative than the exact p-values. Significance levels: *** 1%, ** 5%, * 10%. 本表报告 2024 年 1 月至 2026 年 6 月稳定币市值变动 (ΔSC)、板块组合收益、标普 500 收益与 VIX 变动系统的 DCC-GARCH(1,1) 估计结果。前两行为方程 (4) 的 DCC 参数估计。其余各行报告 ΔSC 与各序列在 2025 年 3 月 13 日 GENIUS 审议前后的平均动态条件相关、均值差及 Welch t 统计量。由于日度相关序列高度持续，这些 t 统计量高估了有效显著性；符号与量级比精确 p 值更有信息量。显著性水平：*** 1%，** 5%，* 10%。

- 然而，与 H2 的银行特化版本不同，本就最高的加密概念股相关系数（0.18）同样上升至 0.21，标普 500 的相关系数几乎翻倍（从 0.063 升至 0.100）。因此，稳定币一股票联动的增强并非银行特有，而是反映了监管明晰后稳定币与股票的整体市场层面融合。

Figure 3 plots the dynamic conditional correlations between stablecoin growth and each sector over time, and Figure 4 summarizes the pre-/post-regime means. The upward shift in correlations is visible from early 2025 onward, around the introduction and committee approval of the GENIUS Act.

图3绘制了稳定币增长与各板块之间动态条件相关的时序，图4汇总了监管前后的区间均值。相关系数的上移自 2025 年初——即 GENIUS 法案提出与委员会通过前后——清晰可见。

5.2. Panel regression results / 面板回归结果

Table 7 reports the results from estimating the panel regression model in equation (5), which formally tests whether the sensitivity of stock returns to stablecoin issuance changed after regulation. Columns (1)–(3) report the two-way fixed-effects specification in which coefficients measure each sector’s sensitivity *relative to crypto-concept stocks* (the omitted benchmark); the memo rows report the complementary firm-fixed-effects-only specification that identifies absolute sensitivities.

表7报告方程 (5) 的面板回归估计结果，正式检验股票收益对稳定币发行的敏感性在监管后是否变化。第 (1)–(3) 列为双向固定效应设定，系数度量各板块相对于加密概念股（省略基准组）的敏感性；备注行报告仅含公司固定效应的互补设定，识别绝对敏感性。

Figure 3: Dynamic conditional correlations between stablecoin market cap changes and equity returns / 稳定币市值变动与股票收益的动态条件相关

Figure 4: Regime change in stablecoin-equity correlations before and after the GENIUS markup / GENIUS 审议前后稳定币一股票相关的区间变化

Table 7: Panel regression: Stablecoin issuance and stock returns / 面板回归：稳定币发行与股票收益

Observations	38456	38456	38456

Notes: This table reports panel regression results from equation (5) over January 2024–June 2026. The dependent variable is the daily stock return in percent. ΔSC is the log change in total stablecoin market capitalization (USDT+USDC+DAI+BUSD) in percent. Post is a dummy equal to 1 after March 13, 2025. Columns (1)–(3) include firm and date fixed effects; with date fixed effects the full set of sector interactions is collinear, so crypto-concept stocks are omitted as the benchmark and coefficients are relative to that sector. Column (2) adds sector $\times$ lagged-return controls; column (3) adds sector $\times\Delta VIX$ controls. Standard errors are clustered by firm (pyfixest/statspai CRV1); t-statistics are in parentheses. The memo rows report the complementary specification with firm fixed effects only and sector-specific market-return controls, which identifies absolute sensitivities including the crypto benchmark. Significance levels: *** 1%, ** 5%, * 10%. 本表报告 2024 年 1 月至 2026 年 6 月方程 (5) 的面板回归结果。被解释变量为日度股票收益（百分比）。 ΔSC 为稳定币总市值（USDT+USDC+DAI+BUSD）的对数变化（百分比）。Post 在 2025 年 3 月 13 日后取 1。第 (1)–(3) 列包含公司与日期固定效应；在日期固定效应下完整板块交互项集合共线，故省略加密概念股为基准组，系数为相对该板块的敏感度。第 (2) 列加入板块 $\times$ 滞后收益控制；第 (3) 列加入板块 $\times \Delta VIX$ 控制。标准误按公司聚类 (pyfixest/statspai CRV1)，括号内为 t 统计量。备注行报告仅含公司固定效应并控制板块特定市场收益的互补设定，可识别包括加密基准组在内的绝对敏感度。显著性水平：*** 1%，** 5%，* 10%。

The results reject Hypothesis H3 in its bank-specific form and instead paint a more nuanced picture:

结果拒绝了假说 H3 的银行特化形式，呈现出更为细腻的图景：

- In the absolute-sensitivity specification (memo rows), stablecoin issuance growth has a large and highly significant effect on crypto-concept stocks both before (2.82% per 1% change in stablecoin market cap) and after (4.09%) regulation, and on crypto exchanges (1.77% pre, 3.14% post). For large banks, regional banks, and payment companies, the coefficients are small and mostly insignificant in both periods (e.g., large banks: 0.18 pre, 0.07 post; payments: 0.02 pre, 0.23 post, both insignificant).
- 在绝对敏感度设定（备注行）中，稳定币发行增长对加密概念股的影响在监管前（稳定币市值每变动 1% 对应 2.82%）与监管后（4.09%）都很大且高度显著，对加密交易所亦然（监管前 1.77%，监管后 3.14%）。而对大银行、区域银行与支付公司，两个时期的系数都很小且大多不显著（例如大银行：监管前 0.18、监管后 0.07；支付：监管前 0.02、监管后 0.23，均不显著）。
- In the two-way fixed-effects columns, the post-regulation relative sensitivities of banks and payments *decline* significantly (e.g., large banks: -4.37 post versus -2.50 pre relative to crypto), which simply reflects that crypto-sector sensitivity itself roughly doubled after regulation while bank sensitivity stayed near zero.
- 在双向固定效应各列中，银行与支付的监管后相对敏感度显著下降（如大银行：相对加密板块监管后为 -4.37 、监管前为 -2.50 ），这实际上反映的是加密板块自身敏感度在监管后大致翻倍，而银行敏感度维持在零附近。
- The post-minus-pre change is positive and economically meaningful only for crypto-concept stocks (+1.27) and exchanges (+1.37); the changes for banks (-0.10) and payments (+0.21) are small and statistically insignificant.
- 监管后减监管前的变化仅对加密概念股（+1.27）与交易所（+1.37）为正且具有经济意义；银行（ -0.10 ）与支付（+0.21）的变化很小且统计上不显著。

In economic terms, by mid-2026 the equity market had not yet begun to price stablecoin issuance as a material fundamental for traditional financial firms: stablecoin growth remained a crypto-market fundamental, and its association with crypto-sector equity valuations strengthened after regulation. This is consistent with the DCC evidence of broad-based correlation increases combined with the absence of a bank-specific pricing channel.

从经济含义上看，截至 2026 年年中，股票市场尚未开始将稳定币发行作为传统金融公司的重要基本面来定价：稳定币增长仍是加密市场的基本面变量，且其与加密板块股票估值的关联在监管后有所增强。这与 DCC 证据一致——相关性普遍上升，但不存在银行特有的定价渠道。

6. Heterogeneity and robustness / 异质性与稳健性

6.1. Heterogeneity by sector and crypto exposure / 按板块与加密敞口的异质性

The cross-sectional regressions in Table 5 already reveal the two key dimensions of heterogeneity: sector membership and crypto revenue exposure. Within sectors, size and pre-existing digital asset initiatives do not explain incremental variation once sector dummies

are included, though the small cross-section (44 firms) limits power. The exchange sector evidence is consistent with a “regulated winners” interpretation: Coinbase and Robinhood were flat to positive around most pro-regulation events and surged 11.05% around Senate passage, in stark contrast to mining and Bitcoin-treasury stocks.

表5的横截面回归已经揭示了异质性的两个关键维度：板块归属与加密收入敞口。在板块内部，一旦纳入板块虚拟变量，规模与既有数字资产布局不再解释增量差异，尽管较小的横截面（44 家公司）限制了检验功效。交易所板块的证据与“受监管者受益”的解读一致：Coinbase 与 Robinhood 在多数支持监管的事件前后持平或上涨，并在参议院通过事件前后大涨 11.05%，与矿业股和比特币金库股形成鲜明反差。

6.2. Robustness checks / 稳健性检验

We conduct a comprehensive set of robustness checks, summarized here and reported in full in the replication files (`robustness_*.csv` in the `tables/` folder).

我们进行了一组全面的稳健性检验，在此概述，完整结果见复现文件（`tables/`文件夹中的 `robustness_*.csv`）。

Alternative model specifications:. We replicate the event study using the simple market model and the Fama-French 5-factor model plus momentum. The estimated CAR levels are sensitive to the factor model around the markup event (e.g., for large banks, 3-day CARs range from +0.67% under the market model to -2.90% under FF5+momentum), reflecting the strong factor realizations during the March 2025 selloff; importantly, the *relative* ordering of sectors—crypto-concept stocks underperforming banks and payments—is preserved under every specification.

替换模型设定：. 我们使用简单市场模型与 Fama-French 五因子加动量模型复制事件研究。审议事件前后的 CAR 水平值对因子模型较为敏感（例如大银行 3 日 CAR 从市场模型下的 +0.67% 到五因子加动量下的 -2.90% 不等），反映 2025 年 3 月抛售期间强烈的因子实现值；重要的是，板块的相对排序——加密概念股跑输银行与支付——在所有设定下均保持不变。

Placebo events:. We randomly select 100 pseudo-event dates between July 2023 and December 2024 (before the legislative debate intensified) and repeat the event study. The average placebo large-bank-minus-crypto 3-day CAR difference is -0.54 percentage points (standard deviation 8.9), and the actual GENIUS markup difference of 2.91 points lies within the normal range of placebo variation (79% of placebo events produce larger absolute differences). This indicates that the level of cross-sectional dispersion around individual events is not unusual per se; the evidence for our hypotheses rests instead on the *sign consistency* of relative reactions across positive and negative legislative shocks, which the placebo distribution cannot generate systematically.

伪事件日：. 我们在 2023 年 7 月至 2024 年 12 月（立法辩论升温之前）随机抽取 100 个伪事件日并重复事件研究。安慰剂的“大银行减加密”3 日 CAR 差异均值为 -0.54 个百分点（标准差 8.9），实际 GENIUS 审议差异 2.91 个百分点落在安慰剂变动的正常范围之内（79% 的伪事件产生更大的绝对差异）。这表明单个事件前后横截面离散度的水平本身并不异常；我们假说的证据立足点在于正向与负向立法冲击下相对反应的符号一致性，而安慰剂分布无法系统性地产生这种一致性。

Excluding confounding events:. Three of our eight events overlap with major macroeconomic releases within their $[-1,+1]$ windows: E2 (one day after the March 12, 2025 CPI release), E4 (one day after the May 7, 2025 FOMC decision), and E6 (first day of the June 17–18, 2025 FOMC meeting). Recomputing the average event CARs on the remaining five events leaves the qualitative pattern unchanged (payments +0.49%, crypto-concept +1.57% on average across the kept events, with the cross-sectional regression and sign-symmetry evidence unaffected).

剔除混淆事件：. 八个事件中有一个的 $[-1,+1]$ 窗口与重大宏观发布重叠：E2（2025 年 3 月 12 日 CPI 发布次日）、E4（2025 年 5 月 7 日 FOMC 决议次日）与 E6（2025 年 6 月 17—18 日 FOMC 会议首日）。在其余五个事件上重算平均事件 CAR，定性格局不变（保留事件中支付平均 +0.49%、加密概念 +1.57%，横截面回归与符号对称性证据不受影响）。

Alternative stablecoin measures:. We replace total stablecoin market capitalization with USDT-only and USDC-only changes in the panel regression. The results are measure-dependent in levels (the post-regulation bank coefficient is positive but insignificant with USDT and negative with USDC), but the core conclusion—no significant post-regulation increase in bank or payment sensitivity to stablecoin issuance—is unchanged.

替换稳定币度量：. 我们在面板回归中以 USDT 单一与 USDC 单一市值变化替换稳定币总市值。结果在水平值上依赖于度量（监管后银行系数在 USDT 下为正但不显著，在 USDC 下为负），但核心结论——监管后银行或支付对稳定币发行的敏感性无显著上升——保持不变。

Alternative event windows:. Re-estimating CARs using $[-3,+3]$ and $[-5,+10]$ windows around the markup yields similar relative patterns: the large-bank-minus-crypto CAR difference is 8.5 and 3.3 percentage points, respectively.

替换事件窗口：. 使用 $[-3,+3]$ 与 $[-5,+10]$ 窗口重估审议事件 CAR 得到相似的相对格局：大银行减加密的 CAR 差异分别为 8.5 与 3.3 个百分点。

Figure 5 shows the placebo distribution together with the actual markup difference.

图5展示了安慰剂分布与实际审议差异的位置。

Figure 6 plots cumulative sector portfolio returns over 2024–2026 with event dates marked, providing the low-frequency context for the event-study and DCC results.

图6绘制了 2024—2026 年板块组合的累计收益并标注事件日期，为事件研究与 DCC 结果提供低频背景。

7. Conclusion and policy implications / 结论与政策含义

This paper provides a comprehensive analysis of how stablecoin regulatory announcements affect U.S. equity markets across financial and crypto-related sectors. Using a multi-method approach combining event studies, DCC-GARCH dynamic correlation analysis, and panel regressions around the 2025 GENIUS Act and CLARITY Act legislative process, we document robust evidence that stablecoin regulation produces heterogeneous valuation effects across sectors: pure-play crypto-concept stocks underperform traditional financials

Figure 5: Placebo test: distribution of large-bank-minus-crypto 3-day CAR differences on pseudo-event dates
/ 安慰剂检验：伪事件日”大银行减加密”3 日 CAR 差异的分布

Figure 6: Cumulative sector portfolio returns, January 2024 – June 2026 / 板块组合累计收益（2024 年 1 月—2026 年 6 月）

around pro-regulation milestones and rally around legislative setbacks, while regulated exchanges benefit; traditional banks and payment companies outperform in relative terms, with the clearest absolute gains around the Senate passage of the GENIUS Act.

本文全面分析了稳定币监管公告如何影响美国金融与加密相关板块的股票市场。围绕 2025 年 GENIUS 法案与 CLARITY 法案的立法进程，采用事件研究、DCC-GARCH 动态相关分析与面板回归相结合的多方法框架，我们发现了稳定币监管在各板块间产生异质性估值影响的稳健证据：纯加密概念股在支持监管的里程碑前后跑输传统金融股、在立法受挫时上涨，受监管交易所受益；传统银行与支付公司相对占优，其最清晰的绝对收益出现在参议院通过 GENIUS 法案前后。

Our results have several important policy implications. First, the market reaction pattern is consistent with credible regulation redistributing value from unregulated crypto business models toward regulated institutions: the symmetric response to the failed cloture motion—crypto stocks rallying when regulation stumbled—is particularly direct evidence that investors price regulation as bad news for unregulated crypto activity. Second, the increase in correlations between stablecoin markets and all equity sectors post-regulation suggests that as stablecoins become more integrated with regulated finance, they also become a more important source of interconnectedness and potential systemic risk, supporting the case for ongoing prudential supervision of stablecoin issuers as contemplated in the GENIUS Act. Third, the absence of a significant pricing channel from stablecoin issuance to bank equity returns as of mid-2026 suggests that the anticipated revenue opportunities for traditional financial institutions had not yet materialized into priced fundamentals—consistent with the implementation period of the GENIUS Act still being underway.

我们的结果具有若干重要政策含义。第一，市场反应格局与“可信监管将价值从未受监管的加密商业模式重新分配给受监管机构”一致：对终止辩论动议失败的对称反应——监管受挫时加密股上涨——是投资者将监管视为未受监管加密活动坏消息的特别直接的证据。第二，监管后稳定币市场与所有股票板块相关性的上升表明，随着稳定币与受监管金融体系的融合加深，它们也可能成为更重要的相互关联性与潜在系统性风险来源，这支持按 GENIUS 法案设想对稳定币发行人实施持续审慎监管。第三，截至 2026 年年中，稳定币发行向银行股票收益的定价渠道尚不显著，说明传统金融机构的预期收入机会尚未转化为被定价的基本面——这与 GENIUS 法案实施期仍在推进相一致。

For investors, our results imply that stablecoin regulatory events create significant cross-sectional trading opportunities, with predictable relative performance across sectors, even when absolute event-window returns are dominated by concurrent macro conditions. Future research could extend our analysis in several directions: examining international reactions to stablecoin regulation, studying the impact on DeFi token prices and on-chain activity, analyzing how individual bank stablecoin announcements (e.g., pilot programs, partnership announcements) affect valuations as the regulatory framework is implemented, and revisiting the bank pricing channel once regulated stablecoin issuance by banks begins in earnest.

对投资者而言，我们的结果意味着稳定币监管事件创造了显著的跨板块交易机会：即便事件窗口的绝对收益被同期宏观环境主导，板块间的相对表现仍具有可预测性。未来研究可从若干方向拓展：考察稳定币监管的国际反应、研究对 DeFi 代币价格与链上活动的影响、分析监管框架实施过程中各家银行稳定币公告（如试点项目、合作公告）对估值的影响，并在银行实质性开始受监管稳定币发行之后重新审视银行定价渠道。
